

# CUET Mathematics Syllabus 2022

## UNIT I: RELATIONS AND FUNCTIONS

1. Relations and Function Types of relations: Reflexive, symmetric, transitive and equivalence relations. One to one and onto functions, composite functions, inverse of a function. Binary operations.
2. Inverse Trigonometric Functions Definition, range, domain, principal value branches. Graphs of inverse trigonometric functions. Elementary properties of inverse trigonometric functions.

## UNIT II: ALGEBRA

1. Matrices Concept, notation, order, equality, types of matrices, zero matrices, transpose of a matrix, symmetric and skew-symmetric matrices. Addition, multiplication, and scalar multiplication of matrices, simple properties of addition, multiplication, and scalar multiplication. Non-commutativity of multiplication of matrices and existence of non-zero matrices whose product is the zero matrices (restrict to square matrices of order 2). Concept of elementary row and column operations. Invertible matrices and proof of the uniqueness of inverse, if it exists; (Here all matrices will have real entries)
2. Determinants Determinant of a square matrix (upto  $3 \times 3$  matrices), properties of determinants, minors, cofactors, and applications of determinants in finding the area of a triangle. Adjoint and inverse of a square matrix. Consistency, inconsistency, and a number of solutions of a system of linear equations by examples, solving system of linear equations in two or three variables (having unique solution) using the inverse of a matrix.

## UNIT III: CALCULUS

1. Continuity and Differentiability Continuity and differentiability, derivative of composite functions, chain rule, derivatives of inverse trigonometric functions, derivative of implicit function. Concept of exponential, logarithmic functions. Derivatives of  $\log x$  and  $e^x$ . Logarithmic differentiation. Derivative of functions expressed in parametric forms. Second-order derivatives. Rolle's and Lagrange's Mean Value Theorems (without proof) and their geometric interpretations.
2. Applications of Derivatives: Rate of change, increasing/decreasing functions, tangents and normal, approximation, maxima, and minima (first derivative test motivated geometrically and second derivative test given as a provable tool). Simple problems (that illustrate basic principles and understanding of the subject as well as real-life situations). Tangent and Normal.
3. Integrals Integration such as inverse process of differentiation. Integration of a variety of functions by substitution, by partial fractions, and by parts, only simple integrals of the type – are to be evaluated.

Definite integrals as a limit of a sum. Fundamental Theorem of Calculus (without proof). Basic

properties of definite integrals and evaluation of definite integrals.

4. Applications of the Integrals Applications in finding the area under simple curves, especially lines, arcs of circles/parabolas/ellipses (in standard form only), and the area between the two above said curves(the region should be clearly identifiable).

5. Differential Equations Definition, order and degree, general and solutions of a differential equation. Formation of differential equation whose general solution is given. Solution of differential equations by the method of separation of variables, homogeneous differential equations of the first order, and first degree. Solutions of linear differential equation of the type –

#### UNIT IV: VECTORS AND THREE-DIMENSIONAL GEOMETRY

1. Vectors and scalars, magnitude, and direction of a vector. Direction cosines/ratios of vectors. Types of vectors(equal, unit, zero, parallel and collinear vectors), position vector of a point, negative of a vector, components of a vector, the addition of vectors, multiplication of a vector by a scalar, position vector of a point dividing a line segment in a given ratio. Scalar(dot) product of vectors, projection of a vector on a line. Vector(cross) product of vectors, scalar triple product.

2. Three-dimensional Geometry Direction cosines/ratios of a line joining two points. Cartesian and vector equation of a line, coplanar and skew lines, the shortest distance between two lines. Cartesian and vector equation of a plane. The angle between (i)two lines,(ii)two planes, and (iii) a line and a plane. Distance of a point from a plane.

Unit V: Linear Programming Introduction, related terminology such as constraints, objective function, optimization, different types of linear programming(L.P.)problems,mathematicalformulationofL.P.problems,graphicalmethod of solution for problems in two variables, feasible and infeasible regions, feasible and infeasible solutions, optimal feasible solutions(upto three non-trivial constrains).

Unit VI: Probability Multiplications the remunerability. Conditional probability, independent events, total probability, Bayes theorem. Random variable and its probability distribution, mean, and variance of haphazard variable. Repeated independent(Bernoulli)trials and binomial
