

# Difference between Email and Gmail

These days, email is more than simply text; messages can now include multimedia content attachments such as photographs and movies. Gmail is one of the numerous web-based email systems that allow users to send and receive digital messages over the internet. In the table below, the difference between Email and Gmail is explained.

## Key Difference Between Email and Gmail

Email	Gmail
Email stands for Electronic mail.	Gmail stands for Google mail.
Email is a method of transferring digital data via a communication network such as the Internet. It's a sort of electronic communication that includes data such as media files, images, messages, and documents.	Google created the Gmail platform. It's an email client that lets you receive and send messages. It's also free to use, with limited data support.
It is used to send and receive messages through a computer network such as the internet.	It has several functions, including email reminders, virus protection, spam filtering, and more.
There is no advertising included in the email.	Advertisements are present in Gmail. Advertisers pay to get their adverts shown to a certain group of people.
Every day, the Email contains a normal sync time of every four hours.	Gmail allows a maximum sync time of once per hour daily.
It allows you to specify days or even weeks for peak sync periods.	This feature is not available.
It is a system for transferring data.	It has web and POP-based interfaces, just as many other email systems.
Email is a generic name for electronic mail. It's just a method of transmitting digital messages across a communication network, such as the internet.	Gmail is the most popular email client, with built-in virus protection, spam filtering, scheduling, email reminders, and recurring emails, among other features.

## What is Email?

The term "email" refers to electronic mail. It is a technique of exchanging digital communications using digital devices such as computers, laptops, mobile phones, tablets, and other devices. This message transmission takes relatively little time to send and receive messages. Aside from text messages, the user may attach various media items, such as graphics, videos, and photos.

In today's world, email is essential for communication. Individual users and medium to big corporate business companies can utilize it. By specifying a recipient's address, a sender may target their communications to that person. The sender and the recipient must have an email account to send and receive emails. It implies that each user's email address will remain unique.

## What is Gmail?

Gmail is an email service provider by Google. Email cannot be used without an email service provider such as Gmail. It is a well-known email service provider that allows users to send and receive emails via the internet. Gmail uses POP or IMAP protocols. These protocols aid in the retrieval of emails from a server.

Gmail has become the most popular webmail service, with millions of people using it worldwide. Gmail is now a fully-featured email service connected with all of Google's key services and products, including Google+, Google Drive, Hangouts, YouTube, Google Calendar, and more, in addition to its basic interaction with the Google Account.
